

Saving the Rainforest

Though deforestation provides many people money, jobs, etc, it also ruins many lives, for example, the indigenous, native people who live and survive of the rainforest and the exotic, unique animals that live there.

You should be able to cut a few trees to make a bit off money but not as much that is being cut today. Almost the size of 40 football pitches get cut in **ONE MINUTE!** As in some rainforests, the government have rules that if they cut trees, they grow them back. This is good but the trees you cut or destroy are probably hundreds of years

old. Which means that if you plant the trees you cut, it would have to hundreds of years to grow back. By the time they grow back, we might not be alive.

If you cut the trees down, the amazing scientists might not be able to cure many diseases without using materials from the rainforests which would be gone if we don't stop ruining the rainforests. How do you think they cure life-changing diseases such as cancer? They use materials and plants to find cures for illnesses.

After reading this informative page, I hope you change your mind on deforestation and take action.
